ISS / MSS

Storage Arrays for NAS or IP SAN

The ISS (Integrated Storage Servers) and MSS (Modular Storage Server) offerings from Cutting Edge are based on the vendor's own Linux-based OS and provide both NAS and iSCSI connected storage for the organization; including the ability to support both NAS and iSCSI within the same array.

A 64-bit Linux-based O/S, the vendor's EdgeWare operating system drives the arrays, providing the ability to attach the arrays to the infrastructure as iSCSI targets. A single array can expose multiple iSCSI block-level volumes to hosts; with the OS additionally including support for features such as disk-to-disk, disk-to-disk-to-tape, and disk-to-disk-to-USB backup; mirroring; built-in remote replication; multiple RAID levels (including RAID 6); and IP failover. The O/S itself can be updated locally or remotely via Red Hat packages (with built-in signature verification features) with administrative access possible via HTTPS connectivity. A single copy of the software can be used to manage all of the attached ISS/MSS appliances.
